SECTION I

INTRODUCTION

1-1. GENERAL.

1-2. This publication contains operation and service instructions for Receiver Model MSR-1A designed and manufactured by The Hallicrafters Co., Chicago, Illinois.

1-3. PURPOSE.

1-4. Receiver Model MSR-1A is an extremely sensitive, high stability superheterodyne receiver used for the reception of single sideband (upper sideband only), AM, CW, and tone-shift FSK. The receiver covers the 2 MC to 32 MC frequency range in four bands. The receiver is designed to function with Manson Laboratories Frequency Synthesizer Model 402 which generates conversion oscillator, mixer and BFO frequencies.

1-5. This receiver is designed for operation from a 220-volt AC, 47 to 60 CPS, single-phase power source, and will operate for long periods with constant control settings. It differs from ordinary communications receivers in that its stability is derived from the stability of the frequency synthesizer. The receiver is shown in figure 1-1.

1-6. The modes of operation are selectable at the front panel of the receiver. The three positions of the control knob are: SSB for single sideband (USB only), CW for continuous wave reception, and AM for amplitude modulation reception. The BFO (beat frequency oscillator) is operational in both the SSB and CW positions. The sideband crystal filter is effective only in the SSB position. The BFO is disabled when the mode switch is in the AM position.

1-7. The audio output is available at the rear panel of the receiver. This provides a 600-ohm, with center tap, balanced line output. The output level is adjustable from less than -20 DBM to +2 DBM. Loudspeaker operation is obtained with a separate, external power amplifier which raises the level to +30 DBM or 1 watt.

1-8. Modular construction has been employed in the nineteen-inch rack mounted receiver. Any of the following modules can be quickly removed and replaced with ease.

1. RF Deck, Assembly A1
2. IF and Audio Amplifier, Assembly A2
3. Second Converter, Assembly A3
4. 1300 KC Generator Card, Assembly A4
5. 300 KC Generator Card, Assembly A5
6. Power Supply, Assembly A6

1-9. The receiver is mounted on a tilt-slide mechanism which allows the receiver to be slid from its rack mounting and tilted up on end to expose the bottom chassis wiring. The receiver can be locked in any position maintenance personnel find most convenient to use.

1-10. TECHNICAL CHARACTERISTICS.

1-11. The technical characteristics of the Model MSR-1A receiver are listed in table 1-1. Performance of the receiver is based upon use with a Manson Laboratories Frequency Synthesizer Model 402.

1-12. PRELIMINARY CONNECTIONS.

1-13. All connections to and from the receiver are accomplished through mating jacks and plugs located at the rear of the receiver (see figure 1-2).

1. The primary power (220 volts AC $\pm 10\%$, 47-60 CPS) is connected to power jack J7.
2. The antenna is connected to antenna jack J5 through 50-ohm impedance coaxial cable.
3. The audio output (600 ohms impedance, centertapped and balanced) is acquired at jack J6. The receiver is muted by applying a 24-volt potential between pin 5 and ground of this audio output connector.
4. The frequency synthesizer supplies four different signals which are connected in the following manner:
 - a. The tunable frequency output (2.450 to 33.750 MC) of the synthesizer is connected to jack J1 through 50-ohm impedance coaxial cable.

Figure 1-2. Rear Panel View of Receiver MSR-1A.

- b. The 1750 KC BFO output of the synthesizer is connected to jack J2 through 50-ohm coaxial cable.
- c. The 1 MC output of the synthesizer is connected to jack J3 through 50-ohm coaxial cable.
- d. The 100 KC output of the synthesizer is connected to jack J4 through 50-ohm coaxial cable.

TABLE 1-1. TECHNICAL CHARACTERISTICS.

Reception	SSB (USB Only), CW, and AM
Frequency Coverage	2.0 MC through 32 MC in four bands Band 1: 2.0 MC - 4.0 MC Band 2: 4.0 MC - 8.0 MC Band 3: 8.0 MC - 16.0 MC Band 4: 16.0 MC - 32.0 MC
Intermediate Frequency	Bands 3 and 4, single conversion - 1750 KC Bands 1 and 2, dual conversion - 450 KC 1st IF, 1750 KC 2nd IF.
Sensitivity	SSB, less than 0.2 microvolt for 10 DB signal plus noise-to-noise ratio.
Selectivity	SSB, approximately 2700 CPS with un- wanted sidebands rejected greater than 60 DB.
AGC	Holds constant output within 3 DB with input levels from 1 to 1,000,000 microvolts
Receiver Muting	Receiver can be muted by applying a 24-volt DC potential between pin 5 and ground of audio output connector J6.
Power Source	220 volts AC $\pm 10\%$, 47 to 60 CPS
Power Consumption	125 watts
Number of Tubes	14
Audio Output	600 ohms impedance, balanced with center tap at 0 DBM (1 milliwatt).
Antenna Input	50 ohms, unbalanced, nominal impedance
Weight	56 pounds
Mounting Dimensions	Standard 19-inch rack, 5-1/8 inch high panel, and depth from front panel to rear panel surfaces is 20-1/2 inches.

SECTION II

OPERATION

2-1. GENERAL.

2-2. This section describes the operating procedures, controls, and indicators used in the operation of Receiver MSR-1A.

2-3. CONTROLS AND INDICATORS.

2-4. All operating controls and indicators of the receiver are located on the front panel except for the AGC-MGC switch A2S2 and manual gain control A2R33 which are located on the IF and audio amplifier assembly A2. The front panel of Receiver MSR-1A is shown in figure 2-1. The function of the controls and indicators are outlined in table 2-1.

Figure 2-1. Front Panel View of Receiver MSR-1A.

TABLE 2-1. FUNCTION OF CONTROLS

Item	Reference Designation	Positions	Function
POWER switch	S1	ON OFF	Applies primary power to the receiver.
Indicator light	DS1	-	Illuminates to show primary power is applied.
BAND switch	A1S1	2-4 MC 4-8 MC 8-16 MC 16-32 MC	Switches receiver for operation on one of four bands.
MODE SELECTOR switch	A2S1	SSB CW AM	Switches receiver for operation in one of three modes.
TUNING control	-	-	Tunes the coils in the RF deck for a specific frequency within one of the four bands.
VOLUME control	A2R41	MAX	Adjusts the level of signal being fed to the audio amplifier to control output level. Clockwise rotation produces maximum output.
METERING switch	S2		Position of switch determines which of the following relative levels will be displayed on meter M1.
		AF	Displays relative level of AF voltage out of receiver.
		AGC	Displays relative level of AGC voltage being applied to IF amplifier.
		B+	Displays relative level of B+ voltage out of power supply.
		SYNTH	Displays relative level of the variable frequency input from the frequency synthesizer.

TABLE 2-1. FUNCTION OF CONTROLS (CONT).

Item	Reference Designation	Positions	Function
AGC-MGC switch	A2S2	1750 KC	Displays relative level of the 1750 KC BFO input from the frequency synthesizer.
		1300 KC	Displays relative level of the 1300 KC input to the second converter.
		AGC MGC	Position determines whether the voltage from AGC amplifier A2V5 or from MGC control A2R37 will control the gain of the IF amplifier.
MGC control	A2R37	—	Position determines a fixed level of bias to control the IF amplifier gain.
AGC control	A2R33	—	Position determines back-bias applied to IF AGC detector for proper AGC control range.

2-5. OPERATION

2-6. The following steps outline the procedure for operating Receiver MSR-1A.

1. Place POWER switch S1 in the ON position and allow five minutes for the receiver to warm up. Indicator DS1 should light to indicate primary power is applied.
2. Place BAND switch A1S1 in the band position in which operation is desired.
3. Adjust TUNING control until the desired operating frequency appears under the calibrate line cursor in the dial window.
4. Adjust the external frequency synthesizer input to obtain the correct operating frequency.
5. Place METERING switch S1 in the 1300 KC, 1750 KC and SYNTH positions. Adjust the frequency synthesizer input to obtain approximately two-thirds deflection on meter in each position of METERING switch.
6. Place METERING switch S1 in the AF position and adjust the TUNING control for maximum deflection on the meter.

2-7. The system is normally operated with AGC-MGC switch A2S2 in the AGC position.

SECTION III

THEORY OF OPERATION

3-1. GENERAL.

3-2. Receiver Model MSR-1A is an extremely sensitive, high stability superheterodyne used for the reception of single sideband (upper sideband only), AM, CW, and tone shift FSK. The receiver covers the 2 MC to 32 MC frequency range in four octave bands (2 to 4 MC; 4 to 8 MC; 8 to 16 MC; and 16 to 32 MC) and functions with an external frequency synthesizer which generates conversion oscillator, mixer and BFO frequencies. The stability of the receiver is derived from the stability of the frequency synthesizer.

3-3. RF AMPLIFIER AND SECOND CONVERTER.

3-4. The antenna signal is applied through a 50-ohm unbalanced input circuit to an RF amplifier consisting of four tuned circuits and pentode AlV1. A block diagram of the receiver is shown in figure 4-1.

3-5. The output of RF amplifier AlV1 feeds first mixer amplifier AlV2 along with the variable local oscillator input from the external frequency synthesizer. The local oscillator input from the external frequency synthesizer is fed to first mixer AlV2 through injection amplifier AlV3.

3-6. When operating on bands 1 and 2, the frequency input from the synthesizer is set to obtain a difference output frequency of 450 KC from mixer AlV2. When operating on bands 3 and 4, the frequency input from the synthesizer is set to obtain a difference output frequency of 1750 KC from mixer AlV2. The 1750 KC output from the mixer when operating on bands 3 and 4 is applied directly to the IF amplifier through wafer 3 of bandswitch AlS1. The 450 KC output from the mixer when operating on bands 1 and 2 is applied to second converter chassis A3 where it is mixed with a 1300 KC signal to obtain the IF frequency of 1750 KC.

3-7. 1300 KC GENERATOR.

3-8. In the 1300 KC generator, a 300 KC signal from the 300 KC generator is fed to a balanced modulator with a 1 MC input from the frequency synthesizer. The 1300 KC output from the balanced modulator is amplified by buffer amplifier A4Q1 and driver amplifier A4Q2 and is then fed to the second converter.

3-9. 300 KC GENERATOR.

3-10. The 300 KC generator develops its 300 KC signal from a 100 KC input from the frequency synthesizer. The 100 KC input is multiplied three times by frequency multiplier A5Q1 and is fed to buffer amplifier A5Q2 which feeds the balanced modulator in the 300 KC generator.

Figure 3-1. Block Diagram of Receiver MSR-1A.

3-11. IF AMPLIFIER.

3-12. The IF amplifier receives its 1750 KC input from the RF amplifier chassis. The incoming signal is amplified by first IF amplifier A2V1. The CW and AM output of first IF amplifier A2V1 is coupled to second IF amplifier A2V2; SSB signals pass through SSB filter A2FL1 before being applied to the second IF amplifier. Additional amplification is provided by third IF amplifier A2V3. Tube A2V9 serves as a buffer amplifier for the 1750 KC BFO injection signal when MODE SELECTION switch A2S1 is in the SSB or CW position. When MODE SELECTION switch A2S1 is in the AM position, A2V9 serves as a fourth IF amplifier for AM signals.

3-13. DETECTION CIRCUITS.

3-14. The upper sideband and CW output of the third IF amplifier is fed to grid number one (pin 1) of product detector A2V4 through capacitive diode A2CR1. Grid number two (pin 7) of product detector A2V4 receives a 1750 KC input from the BFO buffer amplifier A2V9 through MODE SELECTION switch wafer A2S1Da. The resultant output of product detector A2V4 is coupled through capacitor A2C24 and MODE SELECTION switch wafer A2S1Ea to the audio amplifier section.

3-15. BFO buffer amplifier A2V9 receives its 1750 KC input from the frequency synthesizer. The output of buffer amplifier A2V9 is taken from the plate circuit between capacitors A2C28 and A2C29.

3-16. The AM output of the third IF amplifier is fed to the grid of buffer amplifier A2V9 through MODE SELECTION switch wafer A2S1C. The output of buffer amplifier A2V9 is taken from the plate and is coupled to a detector circuit through capacitor A2C27. The output of the detector circuit is fed to the audio amplifier section through MODE SELECTION switch wafer A2S1Db.

3-17. AUDIO AMPLIFIER.

3-17. The audio amplifier consists of a conventional three-stage push-pull amplifier. The first stage serves as an audio amplifier and phase inverter. The output of the first stage is coupled to A2V7 which drives power amplifier A2V8. A separate winding in output transformer A2T4 is used to obtain a negative feedback signal to improve the performance of the audio amplifier. The amplifier delivers a 1 milliwatt output at 600 ohms impedance, balanced with center tap. The receiver can be muted by applying a 24-volt potential between pin 5 and ground of audio output connector J6.

3-18. AGC AMPLIFIERS.

3-18. Two independent AGC amplifier circuits are used in receiver MSR-1A for control of the RF amplifier and the IF amplifier.

3-19. The 1750 KC IF output frequency of the RF amplifier chassis is also fed internally to AGC amplifier A1V4. The output of the amplifier is rectified and the resultant DC voltage is applied as bias to the grid of RF amplifier A1V1 to control

the RF amplifier gain. This AGC is delayed until the signal at the antenna reaches an amplitude of 5000 microvolts. This level is preset by adjusting back bias potentiometer A1R20.

3-22. The IF amplifier develops its AGC signal from the output of the third IF amplifier. The output of the third IF amplifier is fed to AGC amplifier A2V5. The output of the AGC amplifier is detected and the resultant DC voltage is fed to the grids of the three IF amplifier stages (A2V1, A2V2, and A2V3) to control their gain. The resultant DC control voltage is also fed to capacitive diode A2CR1 located between third IF amplifier A2V3 and product detector A2V4. The level of voltage on capacitive diode A2CR1 determines the degree of coupling of the diode and helps augment the action of the conventional AGC circuits for SSB and CW signals. The threshold level (0.6 microvolts) of the AGC control is preset by back bias potentiometer A2R33.

3-23. The resultant action of all the AGC circuits holds the output of Receiver MSR-1A constant within 3 DB with input levels that may vary from 1 to 1,000,000 microvolts. Because of the delay in AGC control (0.6 microvolts) the receiver has effectively no AGC applied when weak signals are received. If desired, the gain of the IF amplifier can then be set with manual gain control A2R37, however, the AGC will no longer be operative.

3-24. POWER SUPPLY.

3-25. The power supply operates off a 220-volt AC, 47 to 60 CPS input. Three regulated outputs are provided: -24 volts DC at 15 milliamperes maximum, +24 volts DC at 8 milliamperes maximum; and +185 volts DC at 350 milliamperes maximum. Two AC filament outputs are provided: 6.3 volts AC at 6 amperes, and 6.3 volts at 3 amperes. The DC regulated sections of the power supply have been completely transistorized for longer life and reliability.

SECTION IV

MAINTENANCE

4-1. GENERAL.

4-2. Instructions outlined in this section are directed mainly to personnel familiar with electronic equipment. Testing techniques will depend in many cases on the variety of test equipment available. The ingenuity of maintenance personnel is also a factor in adapting the equipment on hand for testing with preventive and corrective maintenance in mind.

4-3. Preventive maintenance differs from corrective maintenance in that its objective is to prevent trouble from occurring. Preventive maintenance is work performed on equipment to keep it in good working order and prevent needless breakdowns and interruptions in service. Corrective maintenance is required when a malfunction of the equipment becomes apparent and an electrical or mechanical adjustment or replacement of components is necessary.

4-4. PREVENTIVE MAINTENANCE.

4-5. Periodic mechanical and electrical checks should be performed by maintenance personnel to minimize equipment failure and maintain continuity of service. The following procedure should be of aid in checking the system for items which may result either in equipment breakdown or in shortening the time of its useful service:

1. Remove all dirt, corrosion, and moisture from receptacles, plugs, cases, and especially in and around RF transmission line connectors.
2. Check the action of all controls for binding, scraping, misalignment, excessive looseness, and positive operation.
3. Examine all plugs and receptacles for firm seating and positive contact.
4. Inspect all cables for signs of breaks, kinks, improper connections, and burned or frayed insulation.
5. Clean the receivers air intake. (See paragraph 4-6.)
6. Inspect all plug-in units, such as tubes, generator cords, and modules, for breakage, loose mounting, and improper seating.
7. Check blower for free rotation.
8. Inspect internal flexible wiring for signs of breaks, improper dress, and burned or frayed insulation.

4-6. CLEANING AIR FILTER.

4-7. Remove the air filter from the front panel. Remove all dirt and dust by washing the filter with a suitable dry cleaning solvent. Dry the filter thoroughly and immerse in a pan of light, clean petroleum oil type SAE 10 or equivalent. After soaking, hang the filter over the oil bath until the droplets cease falling. Replace

air filter in equipment.

4-8. CORRECTIVE MAINTENANCE.

4-9. When the equipment fails to function properly, the trouble may be corrected by mechanical or electrical adjustment, or if necessary, by replacement of one or more defective parts. When a malfunction occurs in a system, the normal procedure is to identify the trouble and localize the source to a particular stage or component by means of the voltage and resistance chart, and schematic diagram.

4-10. The meter on the front panel of Receiver MSR-1A will also be found helpful in many cases for making quick checks on the operation of many critical circuits in the receiver. By rotating METERING switch S2 through its positions, a malfunction will be indicated which would lead maintenance personnel to examine the circuit indicated by the position of the switch. The meter gives relative readings only; once the equipment is installed and operating normally a log should be kept of normal indications. Table 4-1 is provided for this purpose.

TABLE 4-1. NORMAL INDICATIONS FOR METER M1

AF	AGC	B+	SYNTH	1750 KC	1300 KC

4-11. VOLTAGE AND RESISTANCE MEASUREMENTS.

4-12. Voltage and resistance readings taken at the pins of tube sockets in RF deck assembly A1, and IF and audio amplifier assembly A2 are given in tables 4-3 through 4-6. Voltage and resistance readings taken at various points of 2nd converter assembly A3 are given in tables 4-7 and 4-8.

4-13. All voltage and resistance measurements were taken with a Rowan Model 477 VOM. All voltage measurements were made with power applied to the system and under the conditions indicated in the notes listed below each table. All resistance measurements were made with the assemblies removed from the receiver and with no power applied.

4-14. SCHEMATIC DIAGRAMS.

4-15. Schematic diagrams of Receiver MSR-1A are contained in figures 4-3 through 4-9. The reference designation system used in the diagrams represents a unit numbering system. All modules, and cards in the receiver have been assigned an assembly number from A1 through A6. Within each assembly, the parts of a particular group have been assigned consecutive numbers beginning with the number one. For example, each of the assemblies contain a resistor with the designation R1, but these designations

nations are abbreviated. To obtain the complete reference designation of a part, prefix the number found on the schematic diagram with the assembly number. Hence the complete numbers of the first resistor in each assembly would be A1R1, A2R1, A3R1, A4R1, A5R1, and A6R1. The same would hold true for the capacitors, transformers, etc. Parts which are mounted on the basic chassis and front panel are not prefixed with an assembly number.

4-16. ALIGNMENT PROCEDURE.

4-17. The following paragraphs describe the alignment procedure for the various circuits of Receiver MSR-1A. They should only be performed if a critical component has been repaired or replaced or if the circuit is not operating properly. If the entire receiver requires alignment, all stages must be aligned in the same sequence as they appear in the following paragraphs. If only one circuit requires alignment, refer only to the procedure listed under that particular circuit. The location of all adjustment points for the alignment procedures are illustrated in figures 4-1 and 4-2.

4-18. RF AND RF AGC AMPLIFIER ALIGNMENT.

4-19. The following steps describe the procedures for aligning the RF and RF AGC amplifier:

1. Connect a Hewlett-Packard Model 606A, or equivalent, signal generator to antenna input connector J5 on the rear of the receiver.
2. Connect a General Radio Co. Type 583A, or equivalent, audio output power meter to pins 1 and 2 of connector J6 located on the rear panel of the receiver.
3. All of the inputs from the frequency synthesizer should be connected to the receiver; the frequency synthesizer should be operating.
4. Place MODE SELECTOR switch A2S1 in the SSB position.
5. Place AGC-MGC switch A2S2 located on IF amplifier assembly A2 in the MGC position.
6. Set BAND switch A1S1 to the band that is to be adjusted.
7. Set the TUNING control to the lowest point in the band (2 MC, 4 MC, 6 MC, or 16 MC).
8. Adjust the cores of all inductors ganged to the tuning mechanism so that the cores are flush with the bottom of the coil forms. The cores are adjustable with an Allen wrench by turning the screw shaft in or out on top of the chassis.
9. Set all of the trimmer capacitors to approximate mid-range.
10. Set the TUNING control to read the highest frequency in the band (4 MC, 8 MC, 16 MC, or 32 MC).

11. Set the frequency synthesizer to the highest frequency in the band in which the receiver is set (4 MC, 8 MC, 16 MC, or 32 MC).
12. Set the frequency generator to the highest frequency in the band in which the receiver is set (4 MC, 8 MC, 16 MC, or 32 MC).
13. Adjust the output of the frequency generator to obtain a slight reading on the audio output meter.
14. Adjust the cores of the coils for the band being adjusted (See table 4-2.) to obtain maximum reading on the audio output meter. Continually adjust the output of the signal generator to maintain as close to a one milliwatt reading on the power meter as possible.

NOTE

After making an adjustment of the cores on any of the inductors, the two screws which secure the support for the threaded shaft of the core should be loosened and then retightened to ensure alignment of the threaded shaft with the tuning mechanism.

15. Set the TUNING control of the receiver, the frequency synthesizer, and the frequency generator to the lowest frequency in the band in which the receiver is set (2 MC, 4 MC, 8 MC, or 16 MC).
16. Note the reading on the audio output power meter.
17. Adjust the first trimmer capacitor to determine if a higher peak can be obtained on the audio output power meter. If no greater peak can be obtained, the first tank circuit is aligned. Return the capacitor to its original position and proceed to check the second trimmer capacitor. If a higher peak can be obtained by adjusting the trimmer capacitor, note the difference that exists between the peak obtained by adjusting the capacitor and the reading obtained in step 16.
18. Adjust the trimmer capacitor to return the audio output power meter to its original reading noted in step 16.
19. Adjust the coil associated with the trimmer capacitor just adjusted so as to decrease the reading on the audio output power meter by half the amount of the difference observed in step 17.
20. Adjust the trimmer capacitor for peak indication on the audio output power meter.
21. Repeat steps 16 through 20 for each of the other trimmer capacitors in the band.
22. Return the operating frequency of the receiver, frequency synthesizer, and frequency generator to the high end of the band.
23. Note the reading on the audio output power meter.

TABLE 4-2. COIL AND CAPACITOR BAND ASSOCIATION FOR RF DECK

Band NO.	Adjust in this order →					
Band 1	Coil	L7	L8	L16	L17	L29
2-4 MC	Capacitor	C22	C24	C55	C57	C74
Band 2	Coil	L1	L2	L10	L11	L20
4-8 MC	Capacitor	C3	C5	C35	C37	C65
Band 3	Coil	L5	L6	L14	L15	L26
8-16 MC	Capacitor	C16	C18	C49	C51	C71
Band 4	Coil	L3	L4	L12	L13	L23
16-32 MC	Capacitor	C9	C11	C42	C44	C69

24. Adjust the first trimmer capacitor to determine if a higher peak can be obtained on the audio output power meter. If no greater peak can be obtained the first tank circuit is aligned. Return the capacitor to its original position and proceed to check the second trimmer capacitor. If a higher peak can be obtained by adjusting the trimmer capacitor, return the trimmer capacitor to the reading observed in step 23.
25. Adjust the coil associated with the trimmer capacitor just adjusted to obtain a peak indication on the audio output power meter.
26. Note the reading on the audio output power meter.
27. Adjust the coil to obtain a reading on the audio output power meter half-way between the level observed in step 23 and step 26.
28. Adjust the trimmer capacitor to obtain a peak indication on the audio output power meter.
29. Repeat steps 15 through 28 until the sum of the changes caused by all of the trimmer capacitors in a given band equal 3 DB or less.
30. Repeat steps 6 through 29 for the other three bands.
31. Set BAND switch A1S1 in one of the bottom two bands.
32. Set the frequency synthesizer and frequency generator to the same frequency as the receiver.
33. Adjust A1L32 and A1L33 to obtain a peak indication on the audio output power meter.
34. Set BAND switch A1S1 in one of the top two bands.
35. Adjust A1L34 to obtain a peak indication on the audio output power meter.
36. Set BAND switch A1S1 in one of the bottom two bands.
37. Turn control A1R20 fully clockwise.
38. Adjust the frequency generator for an output of 3000 microvolts.
39. Adjust VOLUME control A2R41 to maintain a one milliwatt indication on the audio output power meter.
40. Connect the Rowan Model 477 VOM to the junction of A1C28 and A1R18. Set the meter to read a negative voltage.
41. Adjust A1L37 and A1T1 to obtain a peak indication on the VOM.
42. Adjust A1R20 for an indication of approximately 0.2 volt DC on the VOM.

156-004409

Figure 4-1. Top View of RF Deck.

(NOTE: The reference designations shown are abbreviated. Prefix all reference designations shown with A1 to obtain the complete reference designation.)

4-20. 300 KC GENERATOR ALIGNMENT.

4-21. The following steps describe the procedures for aligning 300 KC generator assembly A5.

1. The 100 KC input from the frequency synthesizer should be connected to J4 on the rear panel of the receiver; the frequency synthesizer should be operating.
2. Connect an oscilloscope to connector J2 on the 300 KC generator assembly A5.
3. Adjust A5T1, A5L1, A5T2, and A5T3 respectively for a maximum output indication on the oscilloscope.
4. Adjust A5R1 for maximum undistorted output signal on the oscilloscope.

NOTE

A final adjustment of the 300 KC generator is made in the 1300 KC generator alignment procedure.

4-22. 1300 KC ALIGNMENT PROCEDURE.

4-23. The following steps describe the procedures for aligning 1300 KC generator assembly A4.

1. The 1 MC input from the frequency synthesizer should be connected to J3 on the rear panel of the receiver; the frequency synthesizer should be operating.
2. Connect an oscilloscope to connector J3 on the 1300 KC generator assembly A4.
3. Adjust A4T1, A4T2, A4L1, A4T3, A4I2 and A4I4 respectively for maximum output indication on the oscilloscope.
4. Adjust A4R1 for maximum undistorted output signal on the oscilloscope.
5. Place METERING switch S2 in the 1300 KC position.
6. Adjust A5R1 on 300 KC generator assembly A5 for a maximum reading of 30 on meter M1 of the receiver.

4-24. SECOND CONVERTER ALIGNMENT PROCEDURE.

4-25. The following steps describe the procedure for aligning second converter assembly A3.

1. All of the inputs from the frequency synthesizer should be connected to the receiver; the frequency synthesizer should be operating.
2. Set BAND switch A1S1 to the 2-4 MC band.

3. Set the TUNING control to read 2 MC in the frequency readout window.
4. Set the frequency synthesizer to 2 MC.
5. Place METERING switch S2 in the 1300 KC position.
6. Adjust A3L1 for maximum meter reading.
7. Place METERING switch S2 in the AF position.
8. Adjust A3L2 for maximum meter reading.

--26. IF AND IF AGC AMPLIFIER ALIGNMENT.

--27. The following steps describe the procedures for aligning the IF and IF AGC amplifier.

1. Connect a Hewlett-Packard Model 606A or equivalent signal generator to connector J1 on the IF chassis.
2. Connect a General Radio Co. Type 583-A or equivalent audio output power meter to pins 1 and 2 of connector J6 located on the rear panel of the receiver.
3. The 1750 KC BFO input from the frequency synthesizer should be connected to connector J2 on the rear panel of the receiver; the frequency synthesizer should be operating.
4. Place MODE SELECTOR switch A2S1 in the AM position.
5. Place AGC-MGC switch A2S2 in the MGC position.
6. Adjust VOLUME control A2R41 for maximum output.
7. Adjust the signal generator for an output of 1750 KC modulated 30% with a 1000-cycle signal.
8. Adjust the output of the signal generator to obtain 1 milliwatt on the audio output power meter.
9. Adjust the top and bottom cores of transformers A2T1 and A2T2 to obtain maximum reading on the audio output power meter. Continually adjust the output of the signal generator to maintain as close to a 1 milliwatt reading on the audio output power meter as possible. The adjustment of the top and bottom cores of transformers A2T1 and A2T2 may react with each other. Consequently, continue to adjust the cores until no further increase of the audio output power meter is observed.
10. Adjust coil L10 to obtain maximum reading on the audio output power meter. Continue to adjust the output of the signal generator to maintain as close to a 1 milliwatt reading on the audio output power meter as possible.

11. Place MODE SELECTOR switch A2S1 in the SSB position and retune the signal generator slightly until an audio signal appears on the audio output power meter.
12. Turn the modulation of the signal generator off. Adjust the signal generator (in clockwise direction) for peak in audio output, maintaining approximately one millivolt output on the audio output power meter.
13. Adjust capacitor A2C32 to obtain a maximum reading on the audio output power meter. Continue to adjust the output of the signal generator to maintain as close to a 1 milliwatt reading on the audio output power meter as possible.
14. Place AGC-MGC switch A2S2 in the AGC position. Connect the AC probe of the Hewlett-Packard 410B VTVM between the diode pin of A2T3 and ground.
15. Adjust the top and bottom cores of transformer A2T3 to obtain maximum output on the VTVM.
16. Disconnect AC probe from A2T3 and connect the DC lead from the 410B VTVM between any point along the AGC line and ground (set meter to read negative).
17. Turn AGC control A2R33 fully counterclockwise.
18. Retune the top and bottom cores of transformer A2T3 for maximum meter reading on the 410B VTVM.
19. Disconnect the 410B VTVM and rotate AGC control A2R33 approximately 90° clockwise.
20. Adjust AGC control A2R33 to obtain no more than a 3 DB variance in output on the audio output power meter while varying the input from the signal generator over a range of from 3 microvolts to 0.3 volts.

4-28. AUDIO AMPLIFIER BALANCE ADJUSTMENT.

4-29. For peak performance, audio amplifier balance adjustment control A2R50 should be adjusted each time a critical component or tube is replaced in the audio amplifier. However, this adjustment should not be attempted unless a distortion analyzer instrument is available. If a distortion analyzer is available proceed as described in the following steps. If a distortion analyzer is not available, adequate performance will be obtained by leaving balance control A2R50 in the position set at the factory.

1. Disconnect cabled plug from connector A2J1 on the IF chassis.
2. Connect a Hewlett-Packard Model 606A or equivalent signal generator to connector A2J1 on the IF chassis.
3. Connect a General Radio Co. Type 583-A or equivalent audio output power meter and a Hewlett-Packard Model 330D or equivalent distortion analyzer to pins 1 and 2 of connector J6 located on the rear panel of the receiver.

4. The 1750 KC BFO input from the frequency synthesizer should be connected to connector J2 on the rear panel of the receiver; the frequency synthesizer should be operating.
5. Place MODE SELECTOR switch A2S1 in the SSB position.
6. Place AGC-MGC switch A2S2 in the AGC position.
7. Adjust VOLUME control A2R41 to obtain 2 milliwatt reading on the audio output power meter as the signal generator input level is increased to 3000 microvolts (0.003 volts) level. (Note - Signal generator is offset from 1750 KC to provide an audio output)
8. Adjust balance control A2R50 to obtain minimum distortion on the distortion analyzer at a 2 milliwatt reading on the audio output power meter.
9. Disconnect the test equipment and reconnect the receiver cable plug back on connector A2J1 of the IF chassis.

4-30. No instructions are given for the alignment of capacitors A2C7 and A2C8 which are associated with the sideband filter A2FL1. (Adjustment of these two capacitors should not be attempted unless a frequency counter and sweep generator are available.)

SECTION V

REPLACEABLE PARTS LIST

5-1. GENERAL

5-2. This section contains a description and part number of the replaceable parts of the receiver. The tables are arranged in the following order:

<u>Table No.</u>	<u>Component</u>	<u>Assembly</u>	<u>Page</u>
5-1	Receiver MSR-1A		5-3
5-2	RF Deck Assembly	A1	5-6
5-3	IF and Audio Amplifier Assembly	A2	5-13
5-4	2nd Converter Assembly	A3	5-20
5-5	1300 KC Generator Assembly	A4	5-22
5-6	300 KC Generator Assembly	A5	5-24
5-7	Power Supply Assembly	A6	5-26

5-3. MANUFACTURER'S CODE.

5-4. The following codes are used in the Replaceable Parts List to denote manufacturer of specific parts:

<u>Code</u>	<u>Name and Address</u>
00656	Aerovox Corp., New Bedford, Mass.
01121	Allen-Bradley Co., Milwaukee, Wis.
01281	Pacific Semiconductors, Inc., Culver City, Calif.
01295	Texas Instruments, Inc., Semiconductor-Components Div., Dallas, Texas
03508	General Electric Co., Semiconductor Products Dept., Syracuse, N. Y.
05432	Jaidinger Manufacturing Co., Chicago, Ill.
24455	General Electric Co., Lamp Division, Nela Park, Ohio
26916	The Hallicrafters Co., Chicago, Ill.
49956	Raytheon Co., Lexington, Mass.
55026	Simpson Electric Co., Chicago, Ill.
56289	Sprague Electric Co., North Adams, Mass.
71279	Cambridge Thermionic Corp., Cambridge, Mass.
71468	Cannon Electric Co., Los Angeles, Calif.
72136	Electro Motive Mfg. Co., Willimantic, Conn.
72982	Erie Resistor Corp., Erie, Pa.
72983	Essex Wire Corp., Fort Wayne, Ind.
74970	Johnson, E. F. Co., Waseca, Minn.
75042	International Resistance Co., Philadelphia, Pa.
75915	Littelfuse, Inc., Des Plaines, Ill.
76854	Oak Mfg. Co., Crystal Lake, Ill.
80058	Joint Electronic Type Designation System
80131	Electronic Industries Association, Washington, D. C.
80142	Howard Industries, Inc., Racine, Wis.
81349	Military Specifications
81640	Control Switch Division, Controls Co. of America, Folcroft, Pa.

<u>Code</u>	<u>Name and Address</u>
91418	Radio Materials Co., Chicago, Ill.
91637	Dale Electronics, Inc., Columbus, Nebr.
91737	Gremar Mfg. Co., Inc., Wakefield, Mass.
93332	Sylvania Electric Products, Inc., Woburn, Mass.
96733	San Fernando Electric Mfg. Co., San Fernando, Calif.
96906	Military Standards
98291	Sealelectro Corp., Mamaroneck, N. Y.

R10	Fixed, Composition (220 ohms, 10%, 1/2W)	81349	RC20GF221K	450-242221
R11	Fixed, Composition (4700 ohms, 10%, 1/4W)	81349	RC07GF472K	450-842472
R12	Fixed, Composition (5600 ohms, 10%, 1/4W)	81349	RC07GF562K	450-842562
R13	Fixed, Wire Wound (22,500 ohms, 1%, 5W)	91637	RS-5-2252F	446-045225-29
R14	Fixed, Composition (56K ohms, 10%, 2W)	81349	RC42GF563K	450-542563
R15	Fixed, Wire Wound (4000 ohms, 1%, 1/2W)	91637	Type MRS-1/2	023-000583
R16	Fixed, Wire Wound (1500 ohms, 1%, 1/2W)	91637	Type MRS-1/2	023-000584
R17	Fixed, Wire Wound (50K ohms, 1%, 5W)	91637	RS-5-503F	446-045503-00
R18	Variable (20K ohms, 1W)	75042	Type 100	025-002435
R19	Fixed, Wire Wound (10K ohms, 3%, 10W)	91637	RH10G103H	454-102103-000
R20	Fixed, Wire Wound (9000 ohms, 5%, 10W)	44655	1754A	024-001526
R21	Not Used			
R22	Fixed, Wire Wound (14K ohms, 5%, 5W)	56289	452E143J	024-001527
